Cellular localization Nucleus . Cytoplasm . Nuclear, but also found in the cytoplasm in an inactive

form complexed to an inhibitor (I-kappa-B) (PubMed:1493333). Colocalized with DDX1 in the nucleus upon TNF-alpha induction (PubMed:19058135).

Colocalizes with GFI1 in the nucleus after LPS stimulation (PubMed:20547752). Translocation to the nucleus is impaired in L.monocytogenes infection (PubMed:20855622).

RELA; NFKB3; Transcription factor p65; Nuclear factor NF-kappa-B p65 **Alternative Names**

subunit; Nuclear factor of kappa light polypeptide gene enhancer in B-cells 3

NF-kappa-B is a ubiquitous transcription factor involved in several biological **Background**

processes. It is held in the cytoplasm in an inactive state by specific inhibitors. Upon degradation of the inhibitor, NF-kappa-B moves to the nucleus and activates transcription of specific genes. NF-kappa-B is composed of NFKB1 or NFKB2 bound to either REL, RELA, or RELB. The most abundant form of NF-kappa-B is NFKB1 complexed with the product of this gene, RELA. Four transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Sep 2011],
